Intel x86 Processors

- **Dominate laptop/desktop/server market**
- **Evolutionary design**
 - Backwards compatible up until 8086, introduced in 1978
 - Added more features as time goes on
- **x86 is a Complex Instruction Set Computer (CISC)**
 - Many different instructions with many different formats
 - But, only small subset encountered with Linux programs
- **Compare: Reduced Instruction Set Computer (RISC)**
 - RISC: *very few* instructions, with *very few* modes for each
 - RISC can be quite fast (but Intel still wins on speed!)
 - Current RISC renaissance (e.g., ARM, RISC-V), especially for low-power

x86 Clones: Advanced Micro Devices (AMD)

■ Historically

- AMD has followed just behind Intel
- A little bit slower, a lot cheaper

■ Then

- Recruited top circuit designers from Digital Equipment Corp. and other downward trending companies
- Built Opteron: tough competitor to Pentium 4
- Developed x86-64, their own extension to 64 bits

■ Recent Years

- Intel got its act together
 - 1995-2011: Lead semiconductor “fab” in world
 - 2018: #2 largest by \$\$ (#1 is Samsung)
 - 2019: reclaimed #1
- AMD fell behind
 - Relies on external semiconductor manufacturer GlobalFoundries
 - ca. 2019 CPUs (e.g., Ryzen) are competitive again

Intel's 64-Bit History

- **2001: Intel Attempts Radical Shift from IA32 to IA64**
 - Totally different architecture (Itanium, AKA “Itanic”)
 - Executes IA32 code only as legacy
 - Performance disappointing
- **2003: AMD Steps in with Evolutionary Solution**
 - x86-64 (now called “AMD64”)
- **Intel Felt Obligated to Focus on IA64**
 - Hard to admit mistake or that AMD is better
- **2004: Intel Announces EM64T extension to IA32**
 - Extended Memory 64-bit Technology
 - Almost identical to x86-64!
- **Virtually all modern x86 processors support x86-64**
 - But, lots of code still runs in 32-bit mode

Levels of Abstraction

C programmer

```
#include <stdio.h>
int main() {
    int i, n = 10, t1 = 0, t2 = 1, nxt;
    for (i = 1; i <= n; ++i) {
        printf("%d, ", t1);
        nxt = t1 + t2;
        t1 = t2;
        t2 = nxt; }
    return 0; }
```

**Nice clean layers,
but beware...**

Assembly programmer

Computer Designer

Gates, clocks, circuit layout, ...

 - Various other “addressing modes”

`%rax`

`%rcx`

`%rdx`

`%rbx`

`%rsi`

`%rdi`

Address Computation Instruction

■ `leaq Src, Dst`

- *Src* is address mode expression
- Set *Dst* to address denoted by expression

■ Uses

- Computing addresses without a memory reference
 - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form $x + k*y$
 - $k = 1, 2, 4, \text{ or } 8$

■ Example

```
long m12(long x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax # t = x+2*x
salq $2, %rax           # return t<<2
```

Some Arithmetic Operations

■ Two Operand Instructions:

Format

Computation

<code>addq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} + \text{Src}$
<code>subq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} - \text{Src}$
<code>imulq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} * \text{Src}$
<code>shlq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \ll \text{Src}$
<code>sarq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$
<code>shrq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$
<code>xorq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \wedge \text{Src}$
<code>andq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \& \text{Src}$
<code>orq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \text{Src}$

Synonym: `salq`

Arithmetic

Logical

- Watch out for argument order! *Src, Dest*
(Warning: Intel docs use “op *Dest, Src*”)

- No distinction between signed and unsigned int (why?)

Quiz Time!

Some Arithmetic Operations

■ One Operand Instructions

<code>incq</code>	<i>Dest</i>	$Dest = Dest + 1$
<code>decq</code>	<i>Dest</i>	$Dest = Dest - 1$
<code>negq</code>	<i>Dest</i>	$Dest = -Dest$
<code>notq</code>	<i>Dest</i>	$Dest = \sim Dest$

■ See book for more instructions

- Depending how you count, there are 2,034 total x86 instructions
- (If you count all addr modes, op widths, flags, it's actually 3,683)

Arithmetic Expression Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

arith:

```
leaq    (%rdi,%rsi), %rax
addq    %rdx, %rax
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx
leaq    4(%rdi,%rdx), %rcx
imulq   %rcx, %rax
ret
```

Interesting Instructions

- **leaq**: address computation
- **salq**: shift
- **imulq**: multiplication
 - Curious: only used once...

Understanding Arithmetic Expression

Example

```

long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}

```

arith:

```

leaq    (%rdi,%rsi), %rax    # t1
addq    %rdx, %rax          # t2
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx            # t4
leaq    4(%rdi,%rdx), %rcx   # t5
imulq   %rcx, %rax          # rval
ret

```

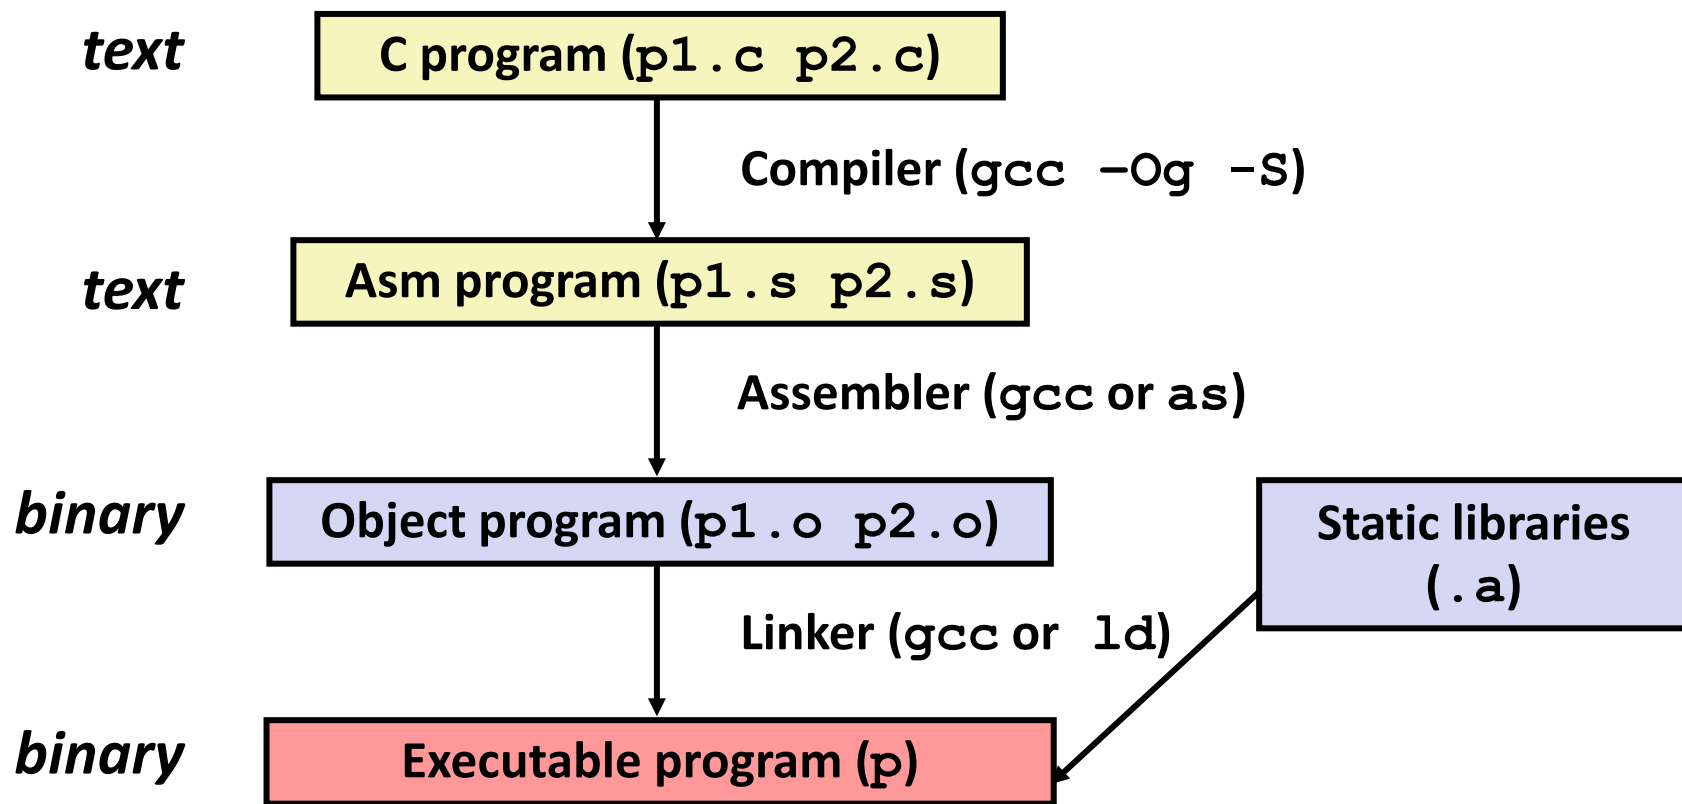

Register	Use(s)
%rdi	Argument x
%rsi	Argument y
%rdx	Argument z , t4
%rax	t1, t2, rval
%rcx	t5

Turning C into Object Code

- Code in files `p1.c` `p2.c`
- Compile with command: `gcc -Og p1.c p2.c -o p`
 - Use basic optimizations (`-Og`) [New to recent versions of GCC]
 - Put resulting binary in file `p`

Compiling Into Assembly

C Code (sum.c)

```
long plus(long x, long y);

void sumstore(long x, long y,
              long *dest)
{
    long t = plus(x, y);
    *dest = t;
}
```

Generated x86-64 Assembly

```
sumstore:
    pushq    %rbx
    movq     %rdx, %rbx
    call     plus
    movq     %rax, (%rbx)
    popq     %rbx
    ret
```

Obtain (on shark machine) with command

```
gcc -Og -S sum.c
```

Produces file `sum.s`

Warning: Will get very different results on non-Shark machines (Andrew Linux, Mac OS-X, ...) due to different versions of gcc and different compiler settings.

What it really looks like

```
.globl  sumstore
.type   sumstore, @function
sumstore:
.LFB35:

pushq   %rbx
.cfi_def_cfa_offset 16
.cfi_offset 3, -16
movq    %rdx, %rbx
call    plus
movq    %rax, (%rbx)
popq    %rbx
.cfi_def_cfa_offset 8
ret
.cfi_endproc
.LFE35:
.size   sumstore, .-sumstore
```

■ Disassembler

`objdump -d sum`

- Useful tool for examining object code
- Analyzes bit pattern of series of instructions
- Produces approximate rendition of assembly code
- Can be run on either a `.out` (complete executable) or `.o` file

Machine Programming I: Summary

■ History of Intel processors and architectures

- Evolutionary design leads to many quirks and artifacts

■ C, assembly, machine code

- New forms of visible state: program counter, registers, ...
- Compiler must transform statements, expressions, procedures into low-level instruction sequences

■ Assembly Basics: Registers, operands, move

- The x86-64 move instructions cover wide range of data movement forms
